

BARRIERS TO GUARD FACILITIES

These security booms are designed for permanent year-round operations. They are ideal for nearshore applications, waterways, marinas and private water bodies.

Barrage booms for the protection of water bodies from Econad are specialized barriers that perfectly cope with the task of protecting water bodies. They represent a steel base with fixed bunnings and special steel spikes that are installed around the entire perimeter of the barrier.

Protection of water bodies – activities aimed at the conservation and restoration of water bodies. This activity extends both to the water bodies themselves and to their water protection zones. In addition, specially protected water bodies are distinguished, including those of international importance. In order to protect water bodies used for drinking and domestic water supply, as well as those containing natural healing resources, zones and districts of sanitary protection are established.

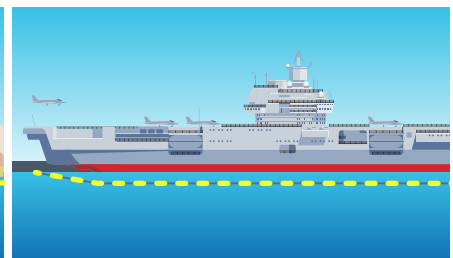

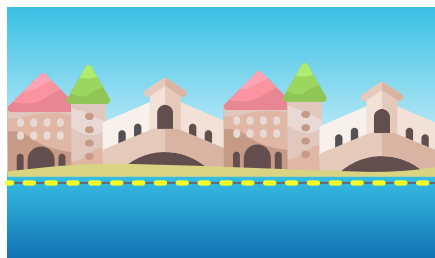

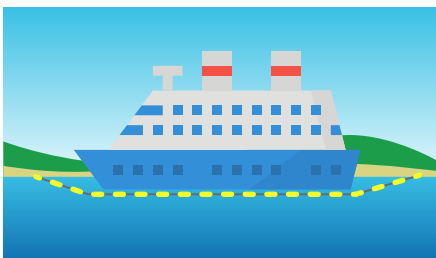

Benefits

1. The booms have been proven to provide the required protection. The tubular backbone makes the boom immensely strong, designed to take loads in excess of 50 tons.
2. The internal closed cell polyurethane foam filling ensures the float will maintain full buoyancy in an unlikely event where the outer float skin is damaged by a heavy collision – they are virtually unsinkable.
3. The quality material used for the outer skin is highly resistant to the damaging effects of UV light and colour fade over time, ideal for applications in high UV environments.

Optional Extras

Upon request, «Econad» company is able to offer supervision of assembly, installation and maintenance.

We can also offer demarcation lighting for additional safety at night.
